

Symetrics™

Alternating Coil Technology

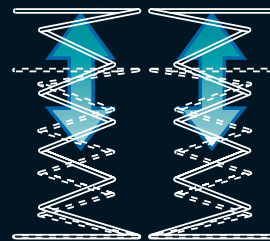

The most advanced open offset coil technology available, Leggett & Platt has created an innerspring system unique in its ability to stabilize the sleep surface and provide supportive comfort across the entire unit area!

Alternate right-hand coils are reversed to reduce partner disturbance and rolling or drifting towards the centre of the mattress, these coils also provide counter balanced deflection that equalizes motion when weight is applied helping to isolate any potential unit movement or side sway.

Computer controlled manufacturing ensures uniformity and consistency of the unit and its edge to edge sleeping support, whilst a premium high coil count improves body contouring and surface coverage.

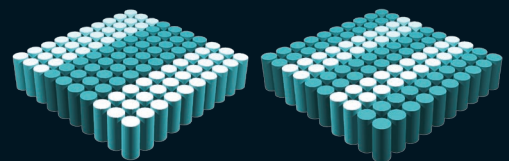

Facing open offset coils provide greater unit stability and prevent movement or side sway

Counterbalanced for straight line deflection to give greater stability and prevent coil or unit lean.

The perfect balance of comfort and support

Symetrics coils can be combined with L&P's ProZone™ technology, allowing the creation of alternating offset innerspring units in 3 and 5 zone configurations.

100% computer controlled, programmable and automated - more efficient than ordinary hand zoning applications"

The Active Support Technology™ of innersprings allow your muscles to relax in a more natural sleep position.

The coils adjust instantly to your sleep movements, comforting and supporting your body actively.
